# Winning Space Race with Data Science

Dmytro P  
9 February 2024

# Outline

---

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

# Executive Summary

---

- Summary of methodologies

A wide range of methodologies were used such as:

- SpaceX Data Collection using SpaceX API
- SpaceX Data Collection with Web Scraping
- SpaceX Data Wrangling
- SpaceX Exploratory Data Analysis using SQL
- Space-X EDA DataViz Using Python Pandas and Matplotlib
- Space-X Launch Sites Analysis with Folium-Interactive Visual Analytics and PlotlyDash
- SpaceX Machine Learning Landing Prediction

- Summary of all results

The analysis reveals varying success rates across launch sites, orbits, and payload types. Notably, KSC LC-39A and VAFB SLC 4E exhibit higher success rates compared to CCAFS LC-40. Success rates tend to increase with flight number at each site, with some achieving perfect success rates after specific flight milestones. While certain orbits consistently achieve 100% success, distinguishing between positive and negative outcomes for GTO orbits remains challenging. Overall, the analysis underscores a steady increase in success rates since 2013, highlighting the advancements and reliability of space missions.

# Introduction

---

- **Project background and context**

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch.

- **Problems we want to find answers to**

SpaceY that would like to compete with SpaceX. In this project, we want to determine the price of each launch. We will do this by gathering information about SpaceX and creating dashboards for our team. We will also determine if SpaceX will reuse the first stage. We will train a machine learning model and use public information to predict if SpaceX will reuse the first stage.

Section 1

# Methodology

# Data Collection

---

- **How data sets were collected.**

We will be working with SpaceX launch data that is gathered from an API, specifically the SpaceX REST API. This API will give us data about launches, including information about the rocket used, payload delivered, launch specifications, landing specifications, and landing outcome. Our goal is to use this data to predict whether SpaceX will attempt to land a rocket or not.

# Flowchart of SpaceX API calls

# Data Collection - Scraping

2020 [68]

In late 2019, Gwynne Shotwell stated that SpaceX hoped for as many as 24 launches for Starlink satellites in 2020,<sup>[49]</sup> in addition to 14 or 15 non-Starlink launches. At 26 launches, 13 of which for Starlink satellites, Falcon 9 had its most prolific year, and Falcon rockets were second most prolific rocket family of 2020, only behind China's Long March rocket family.<sup>[49]</sup>

[76] Flight No.	Date and time (UTC)	Version, Booster <sup>[76]</sup>	Launch site	Payload <sup>[76]</sup>	Payload mass	Orbit	Customer	Launch outcome	Booster landing
78	7 January 2020, 02:19:25 <sup>[49]</sup>	F9 B5 Δ, B1049.4	CCAFS, SLC-40	Starlink 2 v1.0 (50 satellites)	15,600 kg (34,400 lb) <sup>[76]</sup>	LEO	SpaceX	Success	Success (drone ship)
	Third large batch and second operational flight of Starlink constellation. One of the 60 satellites included a test coating to make the satellite less reflective, and thus less likely to interfere with ground-based astronomical observations. <sup>[49]</sup>								
79	19 January 2020, 15:30 <sup>[49]</sup>	F9 B5 Δ, B1046.4	KSC, LC-39A	Crew Dragon in-flight abort test <sup>[49]</sup> (Dragon C205.1)	12,050 kg (26,570 lb)	Sub-orbital <sup>[49]</sup>	NASA (CIS) <sup>[49]</sup>	Success	No attempt
	An atmospheric test of the Dragon 2 abort system after Max Q. The capsule fired its SuperDraco engines, reached an apogee of 40 km (25 mi), deployed parachutes after reentry, and <b>splashed down</b> in the ocean 31 km (19 mi) downrange from the launch site. The test was previously slated to be accomplished with the <b>Crew Dragon Demo-1</b> capsule. <sup>[49]</sup> but that test article exploded during a ground test of SuperDraco engines on 20 April 2019. <sup>[49]</sup> The abort test used the capsule originally intended for the first crewed flight. <sup>[49]</sup> As expected, the booster was destroyed by aerodynamic forces after the capsule aborted. <sup>[49]</sup> First flight of a Falcon 9 with only one functional stage — the second stage had a <b>mass simulator</b> in place of its engine.								
80	29 January 2020, 14:57 <sup>[50]</sup>	F9 B5 Δ, B1051.3	CCAFS, SLC-40	Starlink 3 v1.0 (50 satellites)	15,600 kg (34,400 lb) <sup>[76]</sup>	LEO	SpaceX	Success	Success (drone ship)
	Third operational and fourth large batch of Starlink satellites, deployed in a circular 290 km (180 mi) orbit. One of the failing halves was caught, while the other was fished out of the ocean. <sup>[50]</sup>								
81	17 February 2020, 15:05 <sup>[50]</sup>	F9 B5 Δ, B1056.4	CCAFS, SLC-40	Starlink 4 v1.0 (50 satellites)	15,600 kg (34,400 lb) <sup>[76]</sup>	LEO	SpaceX	Success	Failure (drone ship)
	Fourth operational and fifth large batch of Starlink satellites. Used a new flight profile which deployed into a 212 km x 386 km (132 mi x 240 mi) elliptical orbit instead of launching into a circular orbit and firing the second stage engine twice. The first stage booster failed to land on the drone ship <sup>[50]</sup> due to incorrect wind data. <sup>[50]</sup> This was the first time a flight proven booster failed to land.								
82	7 March 2020, 04:50 <sup>[50]</sup>	F9 B5 Δ, B1059.2	CCAFS, SLC-40	SpaceX CRS-20 (Dragon C112.3 Δ)	1,977 kg (4,359 lb) <sup>[50]</sup>	LEO (ISS)	NASA (CRG)	Success	Success (ground pad)
	Last launch of phase 1 of the CRS contract. Carries BepiColombo, an ESA platform for hosting external payloads onto ISS. <sup>[50]</sup> Originally scheduled to launch on 2 March 2020, the launch date was pushed back due to a second stage engine failure. SpaceX decided to swap out the second stage instead of replacing the faulty part. <sup>[50]</sup> It was SpaceX's 50th successful launch. <sup>[50]</sup> <b>Feb. mission 2020</b> the booster, the third flight of the Dragon C112 and the last launch of the cargo Dragon spacecraft.								
	18 March 2020, 12:19 <sup>[50]</sup>	F9 B5 Δ, B1048.5	KSC, LC-39A	Starlink 5 v1.0 (50 satellites)	15,600 kg (34,400 lb) <sup>[76]</sup>	LEO	SpaceX	Success	Failure (drone ship)

# Data Collection - Scraping

---

- Web scraping to collect Falcon 9 historical launch records from a Wikipedia page titled List of Falcon 9 and Falcon Heavy launches
- [https://en.wikipedia.org/wiki/List\\_of\\_Falcon\\_9\\_and\\_Falcon\\_Heavy\\_launches](https://en.wikipedia.org/wiki/List_of_Falcon_9_and_Falcon_Heavy_launches)
- We will web scrap Falcon 9 launch records with BeautifulSoup:
  - Extract a Falcon 9 launch records HTML table from Wikipedia
  - Parse the table and convert it into a Pandas data frame

# Data Wrangling

---

- Wrangling Data using an API

In some of the columns, like rocket, we have an identification number, not actual data. We'll be targeting another endpoint to gather specific data for each ID number. The data will be stored in lists and will be used to create our dataset.

- Sampling Data

The launch data we have includes data for the Falcon 1 booster whereas we only want falcon 9. We will filter/sample the data to remove Falcon 1 launches.

- Dealing with Nulls

We will deal with the NULL values inside the PayloadMass by calculating the mean of the PayloadMass data and then replacing the null values in PayloadMass with the mean. We will leave the column LandingPad with NULL values, as it is represented when a landing pad is not used. This will be dealt with using one hot encoding later on.

# Wrangling Data using an API

---

Function	Targets	Endpoint
getBoosterVersion		Rockets URL: <a href="https://api.spacexdata.com/v4/rockets">https://api.spacexdata.com/v4/rockets</a>
getLaunchSite		Launchpads URL: <a href="https://api.spacexdata.com/v4/launchpads">https://api.spacexdata.com/v4/launchpads</a>
getPayloadData		Payloads URL: <a href="https://api.spacexdata.com/v4/payloads">https://api.spacexdata.com/v4/payloads</a>
getCoreData		getCoreData URL: <a href="https://api.spacexdata.com/v4/core">https://api.spacexdata.com/v4/core</a>

# EDA with Data Visualization

---

- Summarize what charts were plotted and why you used those charts
- Add the GitHub URL of your completed EDA with data visualization notebook, as an external reference and peer-review purpose

# EDA with Data Visualization

- Objectives:
  - Obtain some preliminary insights about how each important variable would affect the success rate.
  - Select the features that will be used in success prediction.

To achieve this, we perform exploratory Data Analysis and Feature Engineering using Pandas and Matplotlib:

<https://github.com/dpozharov/Testrepo/blob/main/labs/jupyter-labs-eda-dataviz.ipynb.jupyterlite.ipynb>

# EDA with SQL

---

## Summary of the SQL queries performed:

- Display the names of the unique launch sites in the space mission
- Display 5 records where launch sites begin with the string 'CCA'
- Display the total payload mass carried by boosters launched by NASA (CRS)
- Display average payload mass carried by booster version F9 v1.1
- List the date when the first succesful landing outcome in ground pad was acheived.
- List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
- List the total number of successful and failure mission outcomes
- List the names of the booster\_versions which have carried the maximum payload mass.
- List the records which will display the month names, failure landing\_outcomes in drone ship ,booster versions, launch\_site for the months in year 2015.
- Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

# Build an Interactive Map with Folium

---

- Objects we put on the map:
  - All launch sites
  - Mark the success/failed launches for each site
  - The distances between a launch site to its proximities
- Finding an optimal location for building a launch site certainly involves many factors and hopefully we could discover some of the factors by analyzing the existing launch site locations.

[https://github.com/dpozharov/Testrepo/blob/main/labs/lab\\_jupyter\\_launch\\_site\\_location.jupyterlite.ipynb](https://github.com/dpozharov/Testrepo/blob/main/labs/lab_jupyter_launch_site_location.jupyterlite.ipynb)

# Build an Interactive Map with Folium

## Findings:

- Launch sites are in close proximity to railways
- Launch sites in close proximity to highways
- Launch sites in close proximity to coastline
- Launch sites keep certain distance away from cities

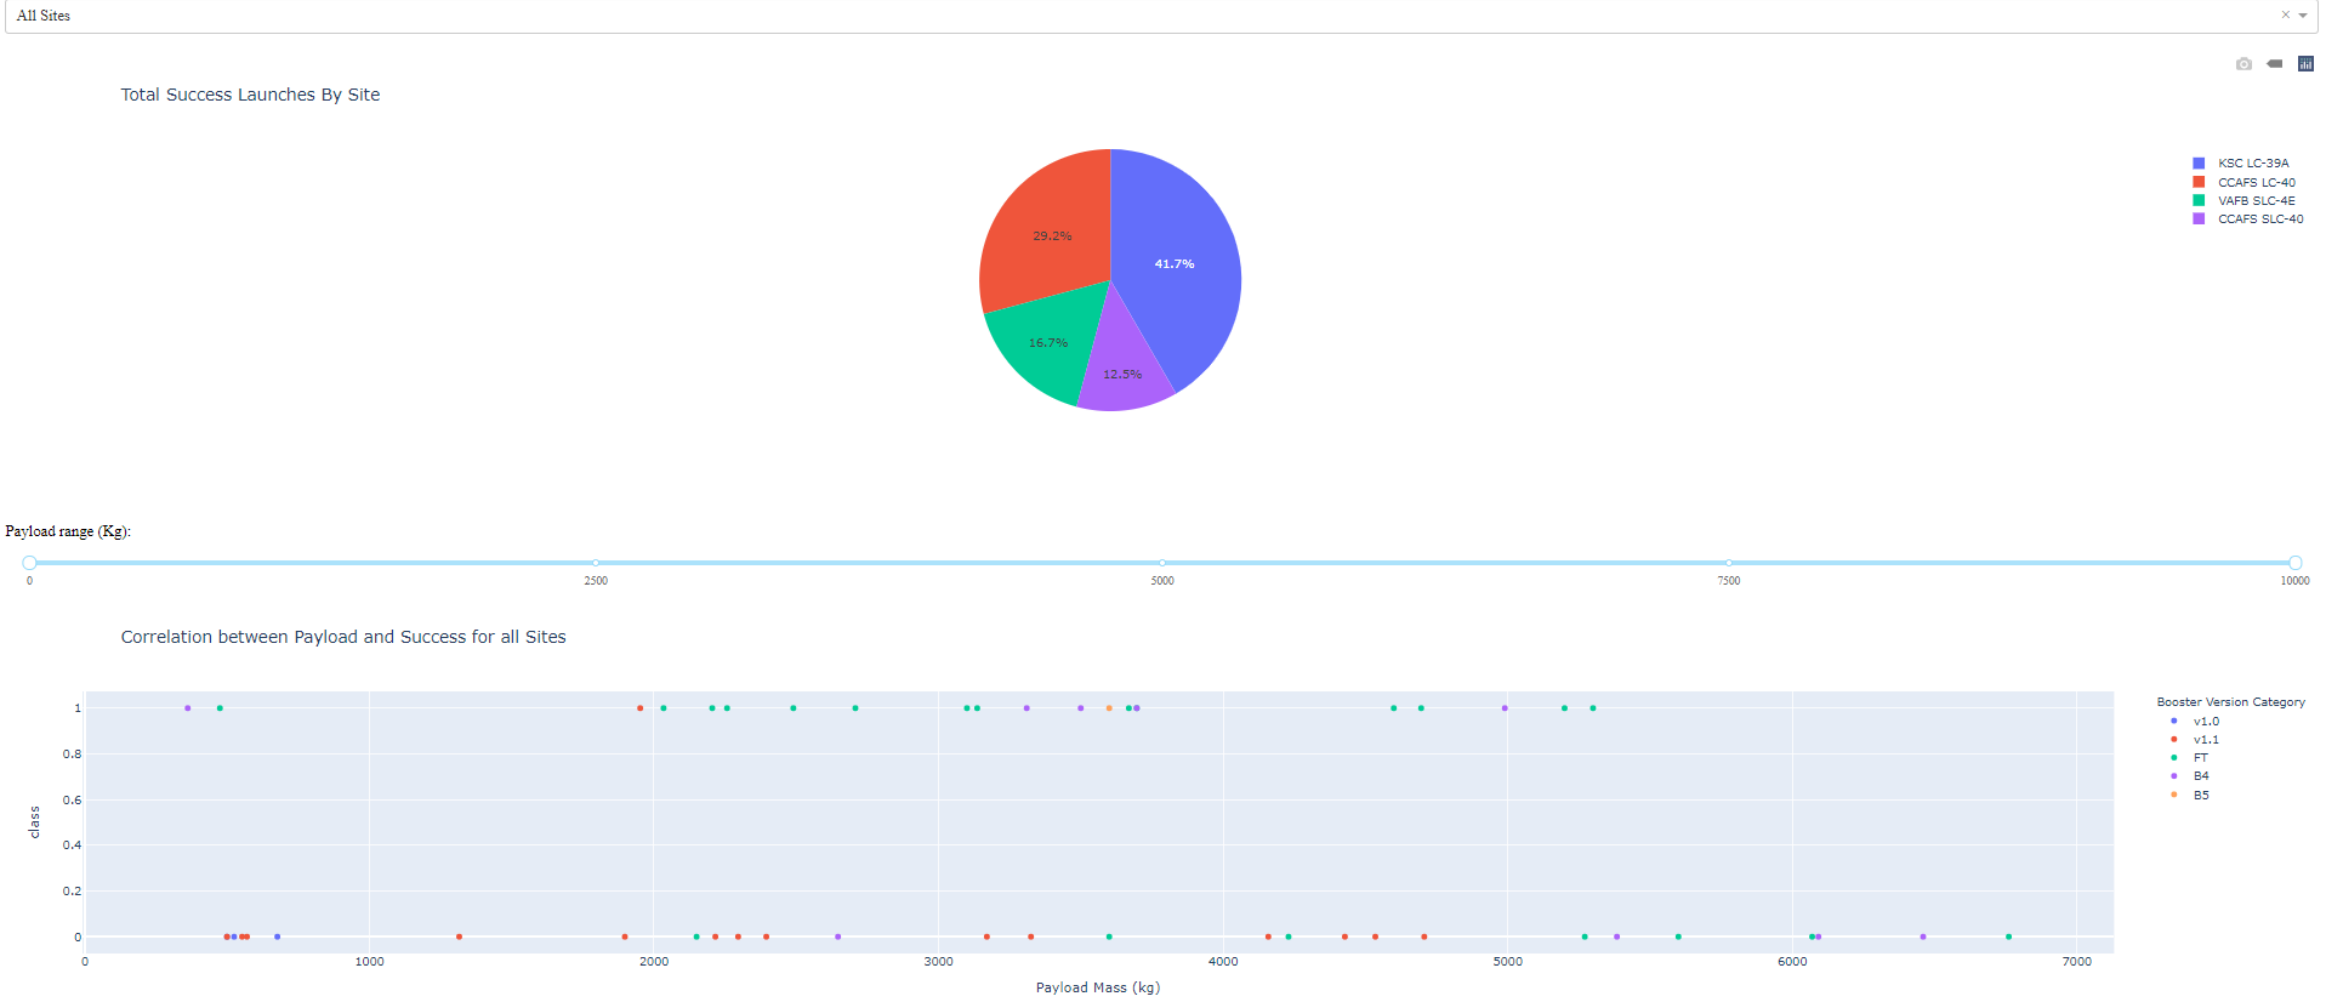

# Build a Dashboard with Plotly Dash

---

- The SpaceX Launch Records Dashboard components:
  - The interactive dropdown component allows to select All Sites or a specific site. The selection affects the graphs below.
  - Pie chart: Which launch site which one has the largest success count.
  - Pie chart: For a specific launch site, check its detailed success rate (class=0 vs. class=1)
  - Scatter chart allows to analyse the payload mass vs launch outcome for the selected site. The interactive slider allows to select the payload range in kg.
- This analysis should help us figure out the best launch sites for a particular payload mass.

# Build a Dashboard with Plotly Dash

## SpaceX Launch Records Dashboard

# Predictive Analysis (Classification)

---

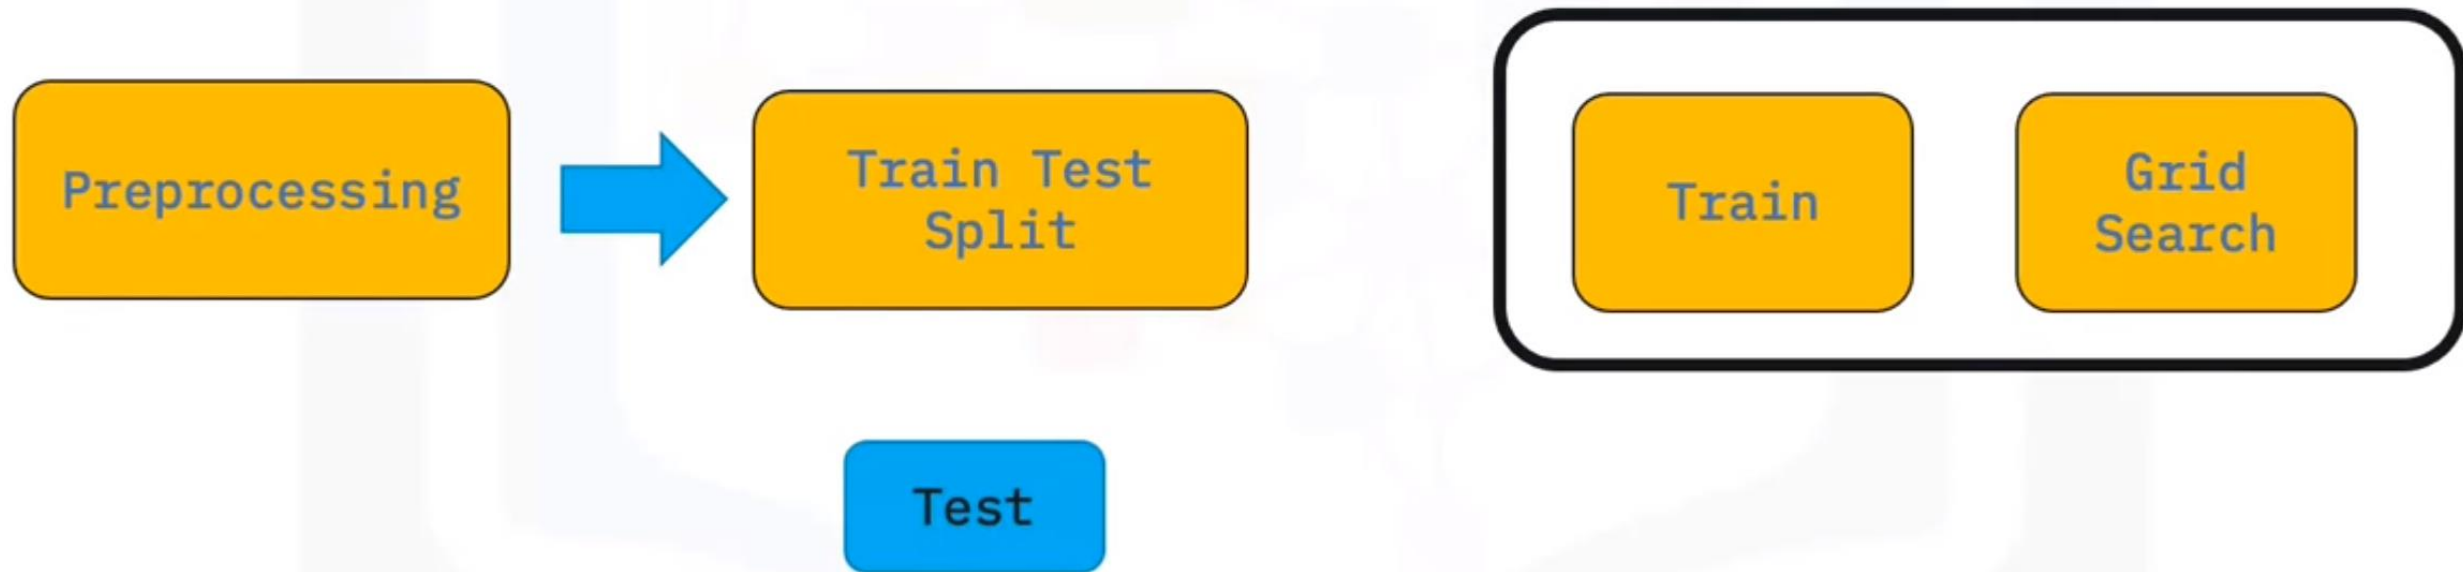

We will build a machine learning pipeline to predict if the first stage of the Falcon 9 lands successfully. This will include:

- Preprocessing, allowing us to standardize our data
- Train\_test\_split, allowing us to split our data into training and testing data,
- We will train the model and perform Grid Search, allowing us to find the hyperparameters that allow a given algorithm to perform best.
- Using the best hyperparameter values, we will determine the model with the best accuracy using the training data.
- You will test Logistic Regression, Support Vector machines, Decision Tree Classifier, and K-nearest neighbors.
- Finally, we will output the confusion matrix.

[https://github.com/dpozharov/Testrepo/blob/main/labs/SpaceX\\_Machine\\_Learning\\_Prediction\\_Part\\_5.jupyterlite.ipynb](https://github.com/dpozharov/Testrepo/blob/main/labs/SpaceX_Machine_Learning_Prediction_Part_5.jupyterlite.ipynb)

# Predictive Analysis (Classification) workflow:

# Predictive Analysis (Classification): Determine Model with Best Accuracy

Test

Model
Logistic Regression
Support Vector Machine
Decision Tree Classifier
K-nearest Neighbors

# Results

---

- **Exploratory data analysis results:**

Having obtained the preliminary insights about how each important variable would affect the success rate, we selected the features that will be used in success prediction:

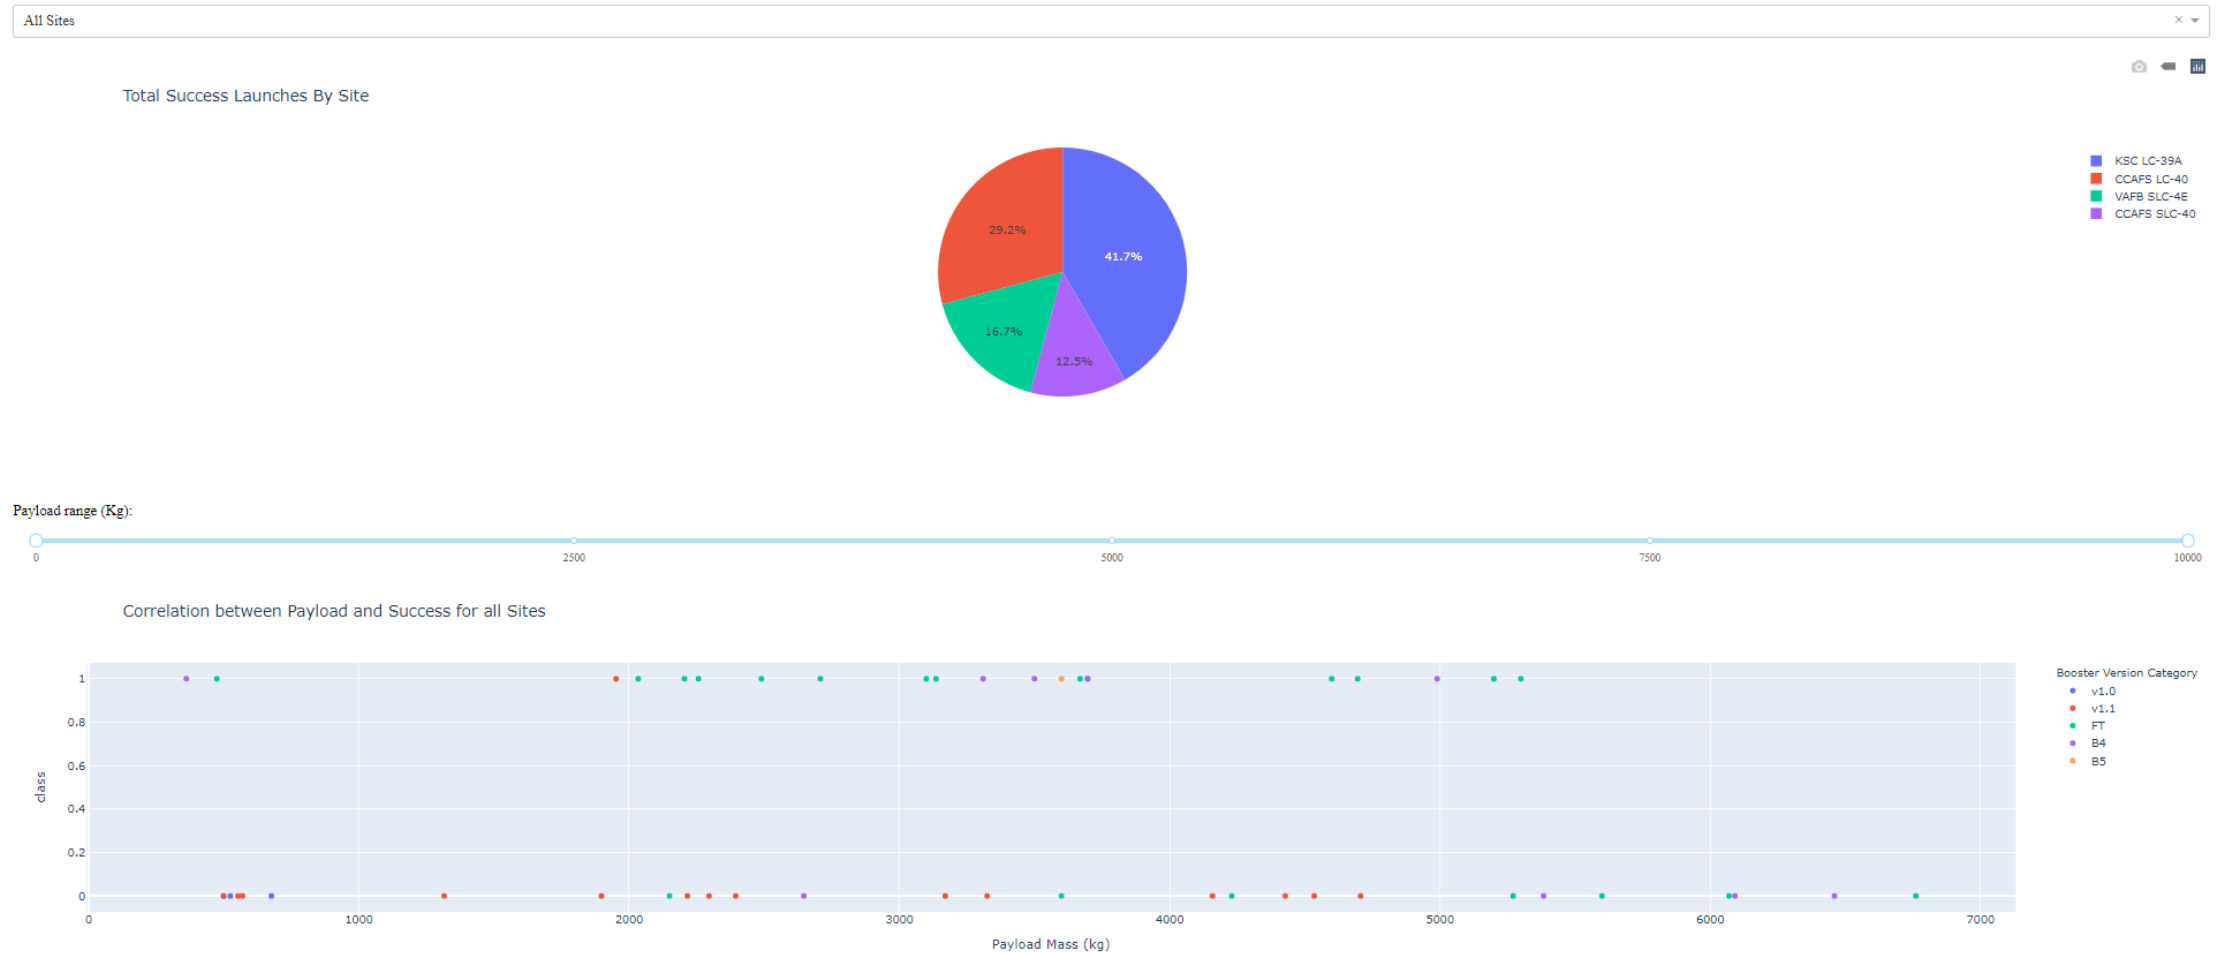

```
features = df[['FlightNumber', 'PayloadMass', 'Orbit', 'LaunchSite', 'Flights', 'GridFins',  
'Reused', 'Legs', 'LandingPad', 'Block', 'ReusedCount', 'Serial']]
```

- Interactive analytics demo in screenshots
- Predictive analysis results

# Results

- Interactive analytics demo in screenshots

## SpaceX Launch Records Dashboard

# Results

- Predictive analysis results: decision tree classifier provides the best prediction

The background of the slide is an abstract composition. It features a dark blue base color. Overlaid on this are numerous diagonal streaks in shades of blue and red, creating a sense of motion or data flow. A faint, light blue grid pattern is also visible, particularly in the lower right quadrant. The overall effect is high-tech and digital.

Section 2

# Insights drawn from EDA

# Flight Number vs. Launch Site

---

- Success rate in general increase with the flight number

# Payload vs. Launch Site

---

Observation: for the VAFB-SLC launchsite there are no rockets launched for heavypayload mass (greater than 10000).

# Success Rate vs. Orbit Type

---

Orbits ES-L1, GEO, HEO and SSO have very high success rate (mean outcome = 1)

# Flight Number vs. Orbit Type

# Payload vs. Orbit Type

Observation: with heavy payloads the successful landing or positive landing rate are more for Polar, LEO and ISS.

However for GTO we cannot distinguish this well as both positive landing rate and negative landing (unsuccessful mission) are both there here.

# Launch Success Yearly Trend

---

The success rate since 2013 kept increasing till 2020

# All Launch Site Names

---

```
%sql select distinct Launch_Site from SPACEXTABLE
```

These are all the launch sites we have in the dataset:

Launch_Site
CCAFS LC-40
VAFB SLC-4E
KSC LC-39A
CCAFS SLC-40

# Launch Site Names Begin with 'CCA'

```
%sql select * from SPACEXTABLE where Launch_Site like "CCA%" limit 5
```

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASS_KG_	Orbit	Customer	Mission_Outcome	Landing_Outcome
2010-06-04	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
2010-12-08	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
2012-05-22	7:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
2012-10-08	0:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
2013-03-01	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

# Total Payload Mass

---

- Calculate the total payload carried by boosters from NASA:  
%sql select sum(PAYLOAD\_MASS\_\_KG\_) from SPACEXTABLE where Customer='NASA (CRS)'
- The Total Payload Mass is 45,596 kg.

<b>sum(PAYLOAD_MASS__KG_)</b>
45596

# Average Payload Mass by F9 v1.1

---

- Calculate the average payload mass carried by booster version F9 v1.1  
%sql select avg(PAYLOAD\_MASS\_\_KG\_) from SPACEXTABLE where  
Booster\_Version='F9 v1.1'
- The average payload mass carried by booster version F9 v1.1 is 2,928.4 kg

<b>avg(PAYLOAD_MASS__KG_)</b>
2928.4

# First Successful Ground Landing Date

---

- Find the dates of the first successful landing outcome on ground pad  
%sql select min(Date) from SPACEXTABLE where Landing\_Outcome='Success (ground pad)'
- The first successful landing outcome on ground pad was on 22 Dec 2015

**min(Date)**

---

2015-12-22

## Successful Drone Ship Landing with Payload between 4000 and 6000

---

- List the names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 but less than 6000  
%sql select Booster\_Version from SPACEXTABLE where  
Landing\_Outcome='Success (drone ship)' and PAYLOAD\_MASS\_\_KG\_  
between 4000 and 6000

### **Booster\_Version**

F9 FT B1022

F9 FT B1026

F9 FT B1021.2

F9 FT B1031.2

# Total Number of Successful and Failure Mission Outcomes

---

- Calculate the total number of successful and failure mission outcomes  
SELECT Mission\_Outcome as Outcome, COUNT(\*) as count  
FROM SPACEXTABLE  
GROUP BY Mission\_Outcome
- Most missions are successful

Outcome	count
Failure (in flight)	1
Success	98
Success	1
Success (payload status unclear)	1

# Boosters Carried Maximum Payload

Booster_Version
F9 B5 B1048.4
F9 B5 B1049.4
F9 B5 B1051.3
F9 B5 B1056.4
F9 B5 B1048.5
F9 B5 B1051.4
F9 B5 B1049.5
F9 B5 B1060.2
F9 B5 B1058.3
F9 B5 B1051.6
F9 B5 B1060.3
F9 B5 B1049.7

- List the names of the booster which have carried the maximum payload mass  
`SELECT distinct b.Booster_Version`
- `FROM SPACEXTABLE b`  
`WHERE b.PAYLOAD_MASS__KG_ IN (`  
`SELECT MAX(PAYLOAD_MASS__KG_)`  
`FROM SPACEXTABLE`  
`)`
- The max payload max is 15600 kg and these are the boosters that were able to carry it

# 2015 Launch Records

---

- List the failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015  
SELECT substr(Date, 6,2) as month, Landing\_Outcome, Booster\_Version, Launch\_Site  
FROM SPACEXTABLE  
WHERE substr(Date,0,5)='2015'  
AND Landing\_Outcome = 'Failure (drone ship)'
- Months when these failures accured:

month	Landing_Outcome	Booster_Version	Launch_Site
01	Failure (drone ship)	F9 v1.1 B1012	CCAFS LC-40
04	Failure (drone ship)	F9 v1.1 B1015	CCAFS LC-40

## Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

---

Landing_Outcome	Count
No attempt	10
Success (drone ship)	5
Failure (drone ship)	5
Success (ground pad)	3
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	2
Precluded (drone ship)	1

- Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order
- The most frequent outcome is No attempt. Then success and failure are almost equally distributed between different landing modes

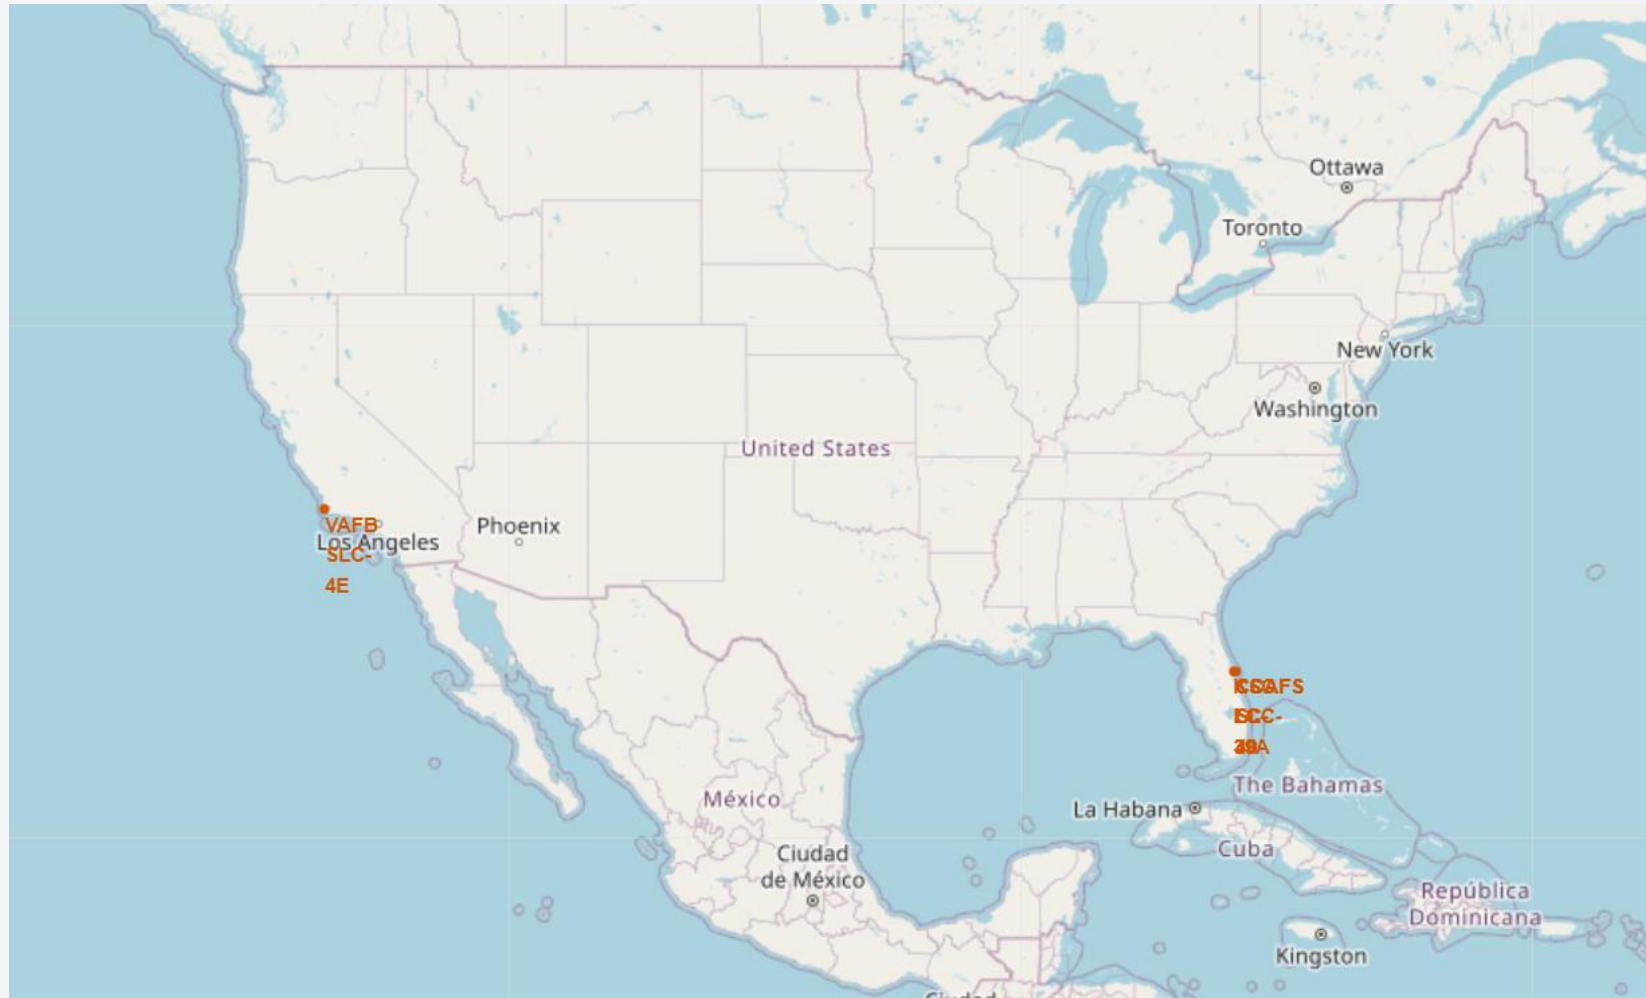

A satellite view of Earth from space, showing the curvature of the planet and city lights at night. The background is a deep blue gradient.

Section 3

# Launch Sites Proximities Analysis

# Launch sites on the map

---

- All launch sites are in the US in close proximity to the Equator line
- All launch sites are in very close proximity to the coast

# Success/failed launches for each site on the map

---

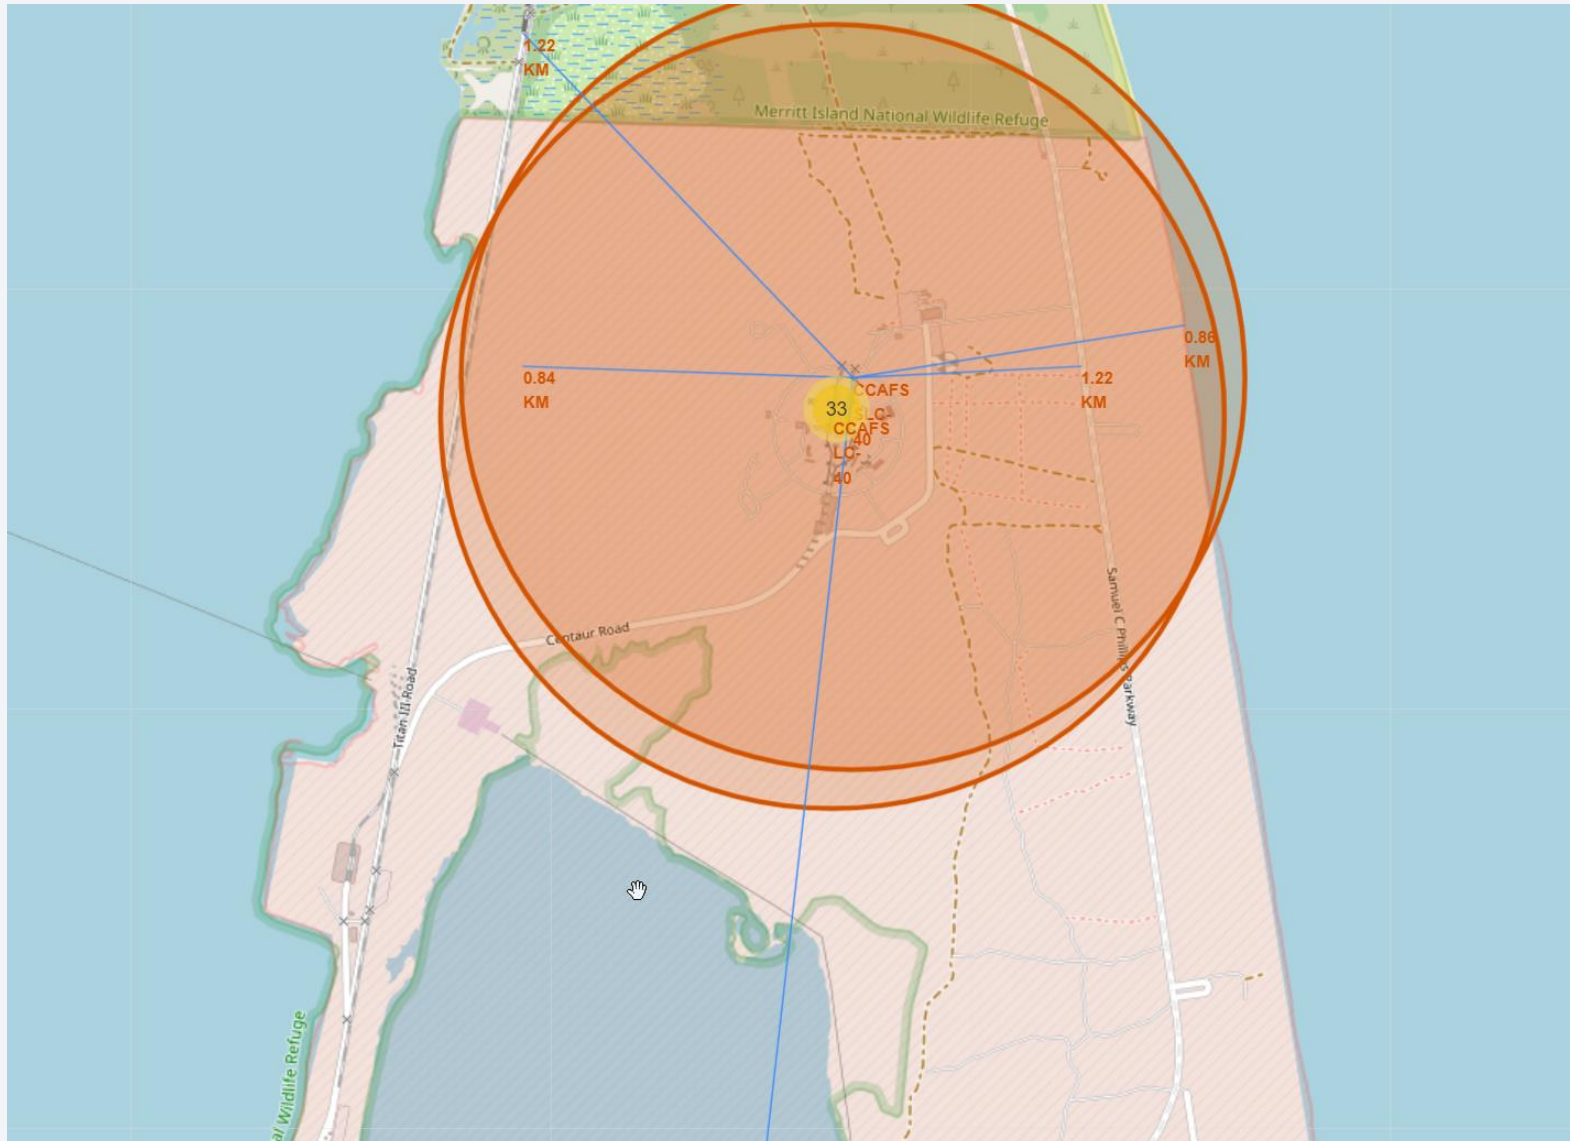

The color-labeled markers in marker clusters allow to easily identify which launch sites have relatively high success rates.

CCAFS LC-40 is shown here.

# Distance lines to the proximities from a launch site

## Findings:

- Launch sites are in close proximity to railways
- Launch sites in close proximity to highways
- Launch sites in close proximity to coastline
- Launch sites keep certain distance away from cities

Section 4

# Build a Dashboard with Plotly Dash

# Total Success Launches by Site

---

KSC LC-39A and CCAFS LC-40 have the highest number of success launches.

# Success vs. Failed Launches for CCAFS LC-40

---

About 27% of failures and 73% of successes

# Payload vs. Launch Outcome for CCAFS LC-40

Payload range (Kg):

0 100

Payload vs. Launch Outcome

The outcome for this particular site and this particular payload mass range heavily depends on the buster version: v1.1 is mostly failures and FT is always success

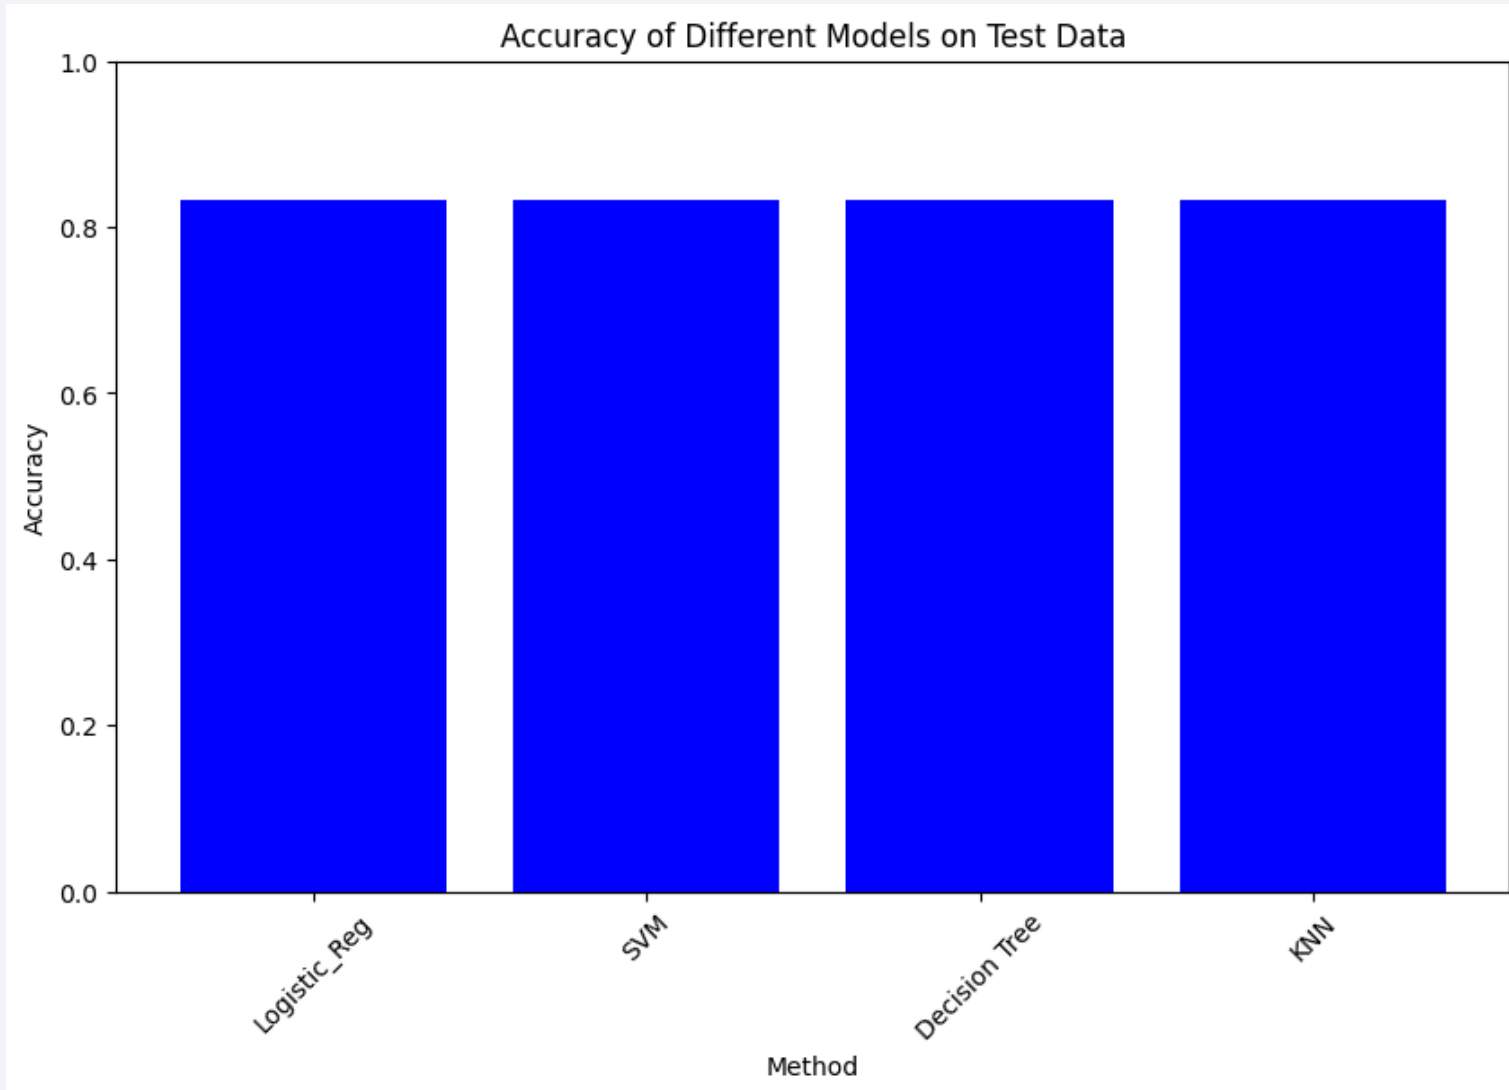

Section 5

# Predictive Analysis (Classification)

# Classification Accuracy

---

- All models have the same classification accuracy

# Confusion Matrix

All the classification model have the same confusion matrices. The major problem is false positives for all the models.

# Conclusions

---

- The success rates vary across different launch sites. Specifically, the success rate at CCAFS LC-40 is 60%, while KSC LC-39A and VAFB SLC 4E have success rates of 77%. It's notable that as the flight number increases at each launch site, the success rate tends to increase as well. For instance, the success rate for VAFB SLC 4E reaches 100% after the 50th flight, while both KSC LC 39A and CCAFS SLC 40 achieve 100% success rates after the 80th flight.
- Regarding payload versus launch site, there is an observation that for the VAFB-SLC launch site, no rockets have been launched for heavy payload masses greater than 10,000.
- In terms of orbits, ES-L1, GEO, HEO, and SSO orbits have the highest success rates, all at 100%. However, the SO orbit stands out with a success rate of approximately 50%, and the orbit SO has a 0% success rate.
- For LEO orbit, success appears to be related to the number of flights, while for GTO orbit, there seems to be no clear relationship between flight number and success rate.
- When considering heavy payloads, successful landings or positive landing rates are more common for Polar, LEO, and ISS orbits. However, distinguishing between positive and negative landing rates for GTO orbit is challenging, as both positive and negative outcomes occur.
- Finally, the success rate has been steadily increasing since 2013 and continued to do so until 2020.

# Appendix

---

- All Jupiter Notebooks and labs are available here:

<https://github.com/dpozharov/Testrepo/tree/main/labs>

Thank you!
